Minimizing And Exploiting Leakage In Vlsi Design:

Minimizing and Exploiting Leakage in VLSI Design Nikhil Jayakumar, Suganth Paul, Rajesh Garg, 2009-12-02 Power consumption of VLSI Very Large Scale Integrated circuits has been growing at an alarmingly rapid rate. This increase in power consumption coupled with the increasing demand for portable hand held electronics has made power consumption a dominant concern in the design of VLSI circuits today. Traditionally dynamic switching power has dominated the total power consumption of an IC. However due to current scaling trends leakage power has now become a major component of the total power consumption in VLSI circuits. Leakage power reduction is especially important in portable hand held electronics such as cell phones and PDAs. This book presents two techniques aimed at reducing leakage power in digital VLSI ICs. The first technique reduces leakage through the selective use of high threshold voltage sleep transistors. The second technique reduces leakage by applying the optimal Reverse Body Bias (RBB) voltage. This book also shows readers how to turn the leakage problem into an opportunity through the use of sub threshold logic.

Minimizing and Exploiting Leakage in VLSI Nikhil Jayakumar, 2010 Power consumption of VLSI Very Large Scale Integrated circuits has been growing at an alarmingly rapid rate. This increase in power consumption coupled with the increasing demand for portable hand held electronics has made power consumption a dominant concern in the design of VLSI circuits today. Traditionally dynamic switching power has dominated the total power consumption of VLSI circuits. However due to process scaling trends leakage power has now become a major component of the total power consumption in VLSI circuits. This dissertation explores techniques to reduce leakage as well as techniques to exploit leakage currents through the use of sub threshold circuits. This dissertation consists of two studies. In the first study techniques to reduce leakage are presented. These include a low leakage ASIC design methodology that uses high V_T sleep transistors selectively, a methodology that combines input vector control and circuit modification, and a scheme to find the optimum reverse body bias voltage to minimize leakage. As the minimum feature size of VLSI fabrication processes continues to shrink with each successive process generation along with the value of supply voltage and therefore the threshold voltage of the devices, leakage currents increase exponentially. Leakage currents are hence seen as a necessary evil in traditional VLSI design methodologies. We present an approach to turn this problem into an opportunity. In the second study in this dissertation we attempt to exploit leakage currents to perform computation. We use sub threshold digital circuits and come up with ways to get around some of the pitfalls associated with sub threshold circuit design. These include a technique that uses body biasing adaptively to compensate for Process Voltage and Temperature (PVT) variations, a design approach that uses asynchronous micro pipelined Network of Programmable Logic Arrays (NPLAs) to help improve the throughput of sub threshold designs, and a method to find the optimum supply voltage that minimizes energy consumption in a circuit.
