Msc Patran Reference Manual:

MSC PATRAN , The Finite Element Method Darrell W. Pepper, Juan C. Heinrich, 2017-04-11 This self explanatory guide introduces the basic fundamentals of the Finite Element Method in a clear manner using comprehensive examples Beginning with the concept of one dimensional heat transfer the first chapters include one dimensional problems that can be solved by inspection The book progresses through more detailed two dimensional elements to three dimensional elements including discussions on various applications and ending with introductory chapters on the boundary element and meshless methods where more input data must be provided to solve problems Emphasis is placed on the development of the discrete set of algebraic equations The example problems and exercises in each chapter explain the procedure for defining and organizing the required initial and boundary condition data for a specific problem and computer code listings in MATLAB and MAPLE are included for setting up the examples within the text including COMSOL files Widely used as an introductory Finite Element Method text since 1992 and used in past ASME short courses and AIAA home study courses this text is intended for undergraduate and graduate students taking Finite Element Methodology courses engineers working in the industry that need to become familiar with the FEM and engineers working in the field of heat transfer It can also be used for distance education courses that can be conducted on the web Highlights of the new edition include Inclusion of MATLAB MAPLE code listings along with several COMSOL files for the example problems within the text Power point presentations per chapter and a solution manual are also available from the web Additional introductory chapters on the boundary element method and the meshless method Revised and updated content Simple and easy to follow guidelines for understanding and applying the Finite Element Method

The Verdict Geometric Quality Library C. J. Stimpson, C. D. Ernst, David C. Thompson, Patrick Michael Knupp, Philippe Pierre Pébay, 2007 Verdict is a collection of subroutines for evaluating the geometric qualities of triangles quadrilaterals tetrahedra and hexahedra using a variety of metrics A metric is a real number assigned to one of these shapes depending on its particular vertex coordinates These metrics are used to evaluate the input to finite element finite volume boundary element and other types of solvers that approximate the solution to partial differential equations defined over regions of space The geometric qualities of these regions is usually strongly tied to the accuracy these solvers are able to obtain in their approximations The subroutines are written in C and have a simple C interface Each metric may be evaluated individually or in combination When multiple metrics are evaluated at once they share common calculations to lower the cost of the evaluation
