Species Act **Environmental Economics** Martha K. Field, Barry C. Field, 2012-09-06 Environmental Economics is an introduction to the basic principles of environmental economics as they have been developed in the past and as they continue to evolve. The examples discussed in this textbook represent only a sample of the full range of issues that actually exist. For this reason, the Sixth Edition sticks to the basic ideas and ways that environmental economists have found to make the basic concepts and models more specific and relevant to concrete environmental issues. The basic structure and sequence of chapters are unchanged but contain new and updated material that reflects the new research efforts by environmental economists over the last few years.

Natural Resource Economics Harry Fleming Campbell, 1999 *Economics for a Sustainable World* Edward B. Barbier, Joanne C. Burgess, 2025-06-30 Written for undergraduate students with little or no exposure to economics, this introductory textbook offers a new perspective on environmental economics for the 21st century. It explains how economics for a sustainable world requires a new approach, accepting that the economy is intrinsically dependent on nature. Drawing on up-to-date case studies from around the globe, the book examines how economic concepts and techniques can apply to a wide range of environmental challenges while ensuring that poor and vulnerable members of society are included in progress toward sustainable development. The book also addresses current environmental policy options and innovations at the local, regional, and international levels. Chapters cover key topics such as climate change, pollution, energy, minerals, forests, land use, oceans, biodiversity, and water scarcity. Included in the book are the following pedagogical features: learning objectives, boxed examples, discussion questions, lists of further resources, and a glossary.

Natural Resources as Capital Larry Karp, 2017-10-27 An introduction to the concepts and tools of natural resource economics, including dynamic models, market failures, and institutional remedies. This introduction to natural resource economics treats resources as a type of capital; their management is an investment problem requiring forward-looking behavior within a dynamic setting. Market failures are widespread, often associated with incomplete or nonexistent property rights complicated by policy failures. The book covers standard resource economics topics, including both the Hotelling model for nonrenewable resources and models for renewable resources. The book also includes some topics in environmental economics that overlap with natural resource economics, including climate change. The text emphasizes skills and intuition needed to think about dynamic models and institutional remedies in the presence of both market and policy failures. It presents the nuts and bolts of resource economics as applied to nonrenewable resources, including the two-period model, stock-dependent costs, and resource scarcity. The chapters on renewable resources cover such topics as property rights as an alternative to regulation, the growth function, steady states, and maximum sustainable yield, using fisheries as a concrete setting. Other less standard topics covered include microeconomic issues such as arbitrage and the use of discounting, policy problems including the Green Paradox, foundations for policy analysis when market failures are important, and taxation. Appendixes offer reviews of the relevant mathematics. The book is suitable for use by upper-level undergraduates or with the
