Phil Gibson, Terri R. Gibson, 2009 In his groundbreaking book *Natural Selection* Charles Darwin explained his theory that evolution is driven by adaptation of species to their environmental surroundings From the tiniest microbe to the largest whale all organisms have changed over vast expanses of time due to the forces of natural selection This new title in the Science Foundations series provides an overview of the processes and causes that drive natural selection and the principles that explain how it operates using numerous diverse organisms as examples *Natural Selection* promotes a solid understanding of how organisms change over the course of generations and how current biodiversity came to be **The Basics of Selection** Graham Bell, 2012-12-06 This new textbook for students taking courses in evolution is addressed to one of the most difficult questions evolutionary biology that of selection Covering both artificial and natural selection the author has written a short readable text that will appeal to students and professionals alike how the nature of the process determines the nature of evolutionary change Artificial Selection and the Development of Evolutionary Theory Carl Jay Bajema, 1980 Natural Selection George Christopher Williams, 1992 This important new volume examines the mechanism and action of natural selection in evolution It includes discussions of the gene as the unit of selection clade selection and macroevolution and other timely issues **The Inadequacy of "Natural Selection"**. Herbert Spencer, 1894 **Natural Selection in the Wild** John A. Endler, 2020-03-31 Natural selection is an immense and important subject yet there have been few attempts to summarize its effects on natural populations and fewer still which discuss the problems of working with natural selection in the wild These are the purposes of John Endler's book In it he discusses the methods and problems involved in the demonstration and measurement of natural selection presents the critical evidence for its existence and places it in an evolutionary perspective Professor Endler finds that there are a remarkable number of direct demonstrations of selection in a wide variety of animals and plants The distribution of observed magnitudes of selection in natural populations is surprisingly broad and it overlaps extensively the range of values found in artificial selection He argues that the common assumption that selection is usually weak in natural populations is no longer tenable but that natural selection is

only one component of the process of evolution natural selection can explain the change of frequencies of variants but not their origins      **Molecular Signatures of Natural and Artificial Selection in Mammalian Genomes** Towfique Raj,2010
