

Mitosis

How do living things grow and repair themselves?

Why?

Living things must grow and develop. At times they suffer injuries or damage, or cells simply wear out. New cells must be formed for the organism to survive. What process must occur to make a new, properly-functioning cell?

The Cell in Mitosis Laurence Levine, 2012-12-02. The Cell in Mitosis is a collection of papers presented at the First Annual Symposium held on November 6-8, 1961, under the provisions of The Wayne State Fund Research Recognition Award. Contributors focus on the complexities posed by the cell in division and consider topics such as the chemical prerequisites for cell division, the role of the centriole in division cycles, development of the cleavage furrow, chemical aspects of the isolated mitotic apparatus, histone variability and actin polymerization. This volume is organized into 11 chapters and begins with an overview of cell division with reference to the basic essential mechanisms of mitogenesis underlying the emergence of the elegant geometries of mitosis. An account of the congression of chromosomes onto metaphase configuration and progression through telophase is also given. The next chapters explore the identity and role of the centriole in the whole life cycle of cell behavior, the fine structure of animal cells during cytokinesis, the mechanism of saltatory particle movements during mitosis and how chemical and physical agents disrupt the mitotic cycle. A chapter is devoted to the holotrichous ciliate *Tetrahymena pyriformis* paying attention to its fine structure during mitosis. This book will be of interest to physiologists, electron microscopists, light microscopists, biochemists and others who want to know more about the various aspects of cell division.

Mitosis, the Movements of Chromosomes in Cell Division Franz Schrader, 1944.

Mitosis David J. Sharp, 2014-03-15. Mitosis Methods and Protocols provides state of the art overviews on the most important approaches currently used in mitosis research spanning from the analysis of single molecules in isolation to their utilization within the complex environment of the cell. The volume is divided into four parts, each focused on methods pertaining to distinct aspects of mitosis research. Part I presents approaches for visualizing and analyzing the dynamic behaviors of the spindle apparatus, the microtubule based machine that drives chromosome segregation. Part II focuses more generally on methods for studying and manipulating the microtubule cytoskeleton in cells and complex cell free extracts. Part III provides state of the art biophysical and high resolution microscopy approaches for assessing complex interactions between microtubules and microtubule associated proteins in isolation as well as microtubule structure in cells. Part IV provides methods for studying the effects of cell shape on cell division and methods for quantifying aneuploidy, aberrant chromosome number which frequently results from mitotic defects and has been linked to human maladies ranging from birth defects to cancer. Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step by step, readily reproducible laboratory protocols and key tips on troubleshooting and avoiding known pitfalls. Authoritative and practical, Mitosis Methods and Protocols seeks to provide diverse methods and new techniques to address new or old questions related

Optical Studies on Cell Division (Mitosis) Norman Miyamoto Baker, 2010 Mitosis is the process by which cells after having duplicated their DNA content segregate chromosomes equally into two identical daughter cells Mitosis is a very short part of a normal cell cycle usually 24 hours and ranges from 30 minutes to an hour depending on cell type and environmental conditions During this incredibly short amount of time the cell undergoes several complex rearrangements biomechanically and biochemically Microtubules 20 nm width dimer polymers play an essential role as the building blocks that provides the cytoskeleton and mitotic spindle for the cell provide the force that segregates chromosomes anaphase to satisfaction of tension and attachment based checkpoints metaphase anaphase transition To elucidate the key role microtubules have in mitosis drugs such as taxol and nocodazole have been used to impart catastrophic global damage to the mitotic spindle and study the effects on cellular division However catastrophic global damage can not answer specific questions regarding highly spatially localized damage and temporally transient damage In elucidating the role of microtubules chromosomes and other key biological structures there is the need for a transient perturbation on the mitotic process To study the effects of transient perturbation on mitosis a Laser microscope system Robolase was developed to deliver spatially localized 0.4 μm and temporally specific disruption inside living cells nanosurgery Specifically the affect of ablating chromosome tips mitotic spindles and chromatid are examined and the relationship between damaged sites and pathways controlling the progression of the cell cycle and DNA damage pathways are examined In conclusion an optically based method for studying mitosis with transient perturbation has been developed and used to determine that chromosome tip disruption affects cytokinetic progression prolonged disruption of mitotic spindle reveals force sensing in the metaphase spindle and double strand breaks of DNA recruit CENP A in addition to known DNA damage proteins *Cell Cycle*
