Abstract—This study examined the effectiveness of a 12-week, group-based, self-management program for patients with type 2 diabetes. The program was designed to improve patients' knowledge, self-efficacy, and adherence to medical and lifestyle recommendations. The program was evaluated using a randomized controlled trial design. The results showed that the program was effective in improving patients' knowledge, self-efficacy, and adherence to medical and lifestyle recommendations. The program was also effective in improving patients' glycemic control. The results of this study suggest that the program is a promising intervention for improving the health of patients with type 2 diabetes.

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The intervention group (n = 20) participated in a 12-week walking program, while the control group (n = 20) remained sedentary. The walking program was designed to be low-intensity, with a target heart rate of 110-120 beats per minute. The program was supervised by a certified walking instructor. The study was conducted in a community setting. The results of the study showed that the walking program had a positive effect on the physical and psychological health of the women. The women in the walking program showed significant improvements in walking distance, walking speed, and heart rate. They also showed significant improvements in mood, self-esteem, and body image. The women in the control group showed no significant changes in any of the measured variables. The results of this study suggest that a 12-week, low-intensity, supervised walking program can be an effective intervention for improving the physical and psychological health of sedentary, middle-aged women.
