INSTALLATION MANUAL

FOR KYOCERA SOLAR MODULE

KC-TYPE SERIES

Please read this manual carefully before installing the modules.

KYOCERA CORPORATION

1. INTRODUCTION

As the world leader in high technology ceramic/silica applications, Kyocera has stepped into the forefront in development of multicrystalline solar modules. Kyocera began researching photovoltaics in 1975 and has supplied many thousands of modules throughout the world since 1978. Its years of experience and state-of-the-art technology have produced quality solar modules in a range of sizes to meet the energy needs of the growing solar market.

2. POWER MODULES

Kyocera "KC" series modules come in various sizes to satisfy a full range of applications. Each module is made of multi-crystalline cells manufactured by the "casting" method. These cells cover nearly 100% of the module's surface. To protect the cells from the most severe environmental conditions, they are encapsulated between a tempered glass cover and an EVA pottant with PVF back sheet. The entire laminate is installed in an anodized aluminum frame for structural strength and ease of installation.

3. APPLICATIONS

Kyocera modules are a reliable, virtually maintenance free power supply, designed to operate efficiently in sunlight. Kyocera solar modules are ideal for charging storage batteries used to power remote homes, recreational vehicles, boats, telecommunication systems and other electric generation application.

4. MOUNTING SITE SELECTION

The solar modules should be mounted in a location where they will receive maximum sunlight throughout the year. In the Northern Hemisphere, the modules should face south, and in the Southern Hemisphere, the modules should face north. Modules facing 30 degrees away from true South (or North) will lose approximately 10 to 15 per cent of their power output. If the module faces 60 degrees away from true South (or North), the power loss will be 20 to 30 per cent. When choosing a site, avoid trees, buildings or obstructions which could cast shadows on the solar modules especially during the winter months when the arc of the sun is lowest over the horizon.

5. MODULE TILT ANGLE

Solar modules produce the most power when they are pointed directly at the sun. For installations where the solar modules are mounted to a permanent structure, the solar modules should be tilted for optimum winter performance. As a rule, if the system power production is adequate in the winter, it will be satisfactory during the rest of the year. The module tilt angle is measured between the solar modules and the ground (Figure 1).

RECOMENDED TILT ANGLES FOR A FIXED SYSTEM	
SITE LATITUDE IN DEGREES	FIXED TILT ANGLE
0° TO 15°	15°
15° TO 25°	SAME AS LATITUDE
25° TO 30°	LATITUDE + 5°
30° TO 35°	LATITUDE + 10°
35° TO 40°	LATITUDE + 15°
40° +	LATITUDE + 20°

6. MOUNTING THE MODULE

The frame of each module has fourteen 7 mm Ø diameter mounting holes (Figure 2). These are used to secure the modules to the supporting structure. The example of a ground mounted structure is shown in Figure 3. The four holes close to the corners of the module are most often used for mounting. Clearance between the module frame and the mounting surface may be required to prevent the junction box from touching the surface, and to circulate cooling air around the back of the module. In case the modules will be mounted on the roof or wall of a building, the standoff method or the rack method are recommended.

STANDOFF: The modules are supported parallel to the surface of the building wall or roof. Clearance between the module frames and surface of the wall or roof is required to prevent wiring damage and to allow air to circulate behind the module.

The recommended standoff height is 4.5 in. (about 115 mm). If other mounting means are employed, this may affect the Listing For Fire Class Ratings.

RACK: The supporting frame is used to mount modules at correct tilt angles. The modules are not designed for integral mounting as part of a roof or wall. The mounting design may have an impact on the fire resistance.
