The organization of a community is based on the utilization of the energy from the sun within a given ecosystem. The community is also defined by the interrelated niches within it.

Within a community, organisms are dependent on the survival of other organisms. Energy is passed from one organism to another.

**Food Chain:** Energy cycles, and is passed, from the sun to a producer (ex: plants) to a consumer (ex: cow) and back into the nutrient pool through decomposers (ex: mushrooms). The greatest amount of energy in a community is in the producers.

## Vocabulary:

**Habitat** – The place in which an animal or plant naturally lives, which provides food, water, shelter, and space. The size of the habitat depends on the organism's needs.

**Organism** – any living thing

**Niches** - The function that an organism performs in the food web of that community; it includes everything that an organism does and needs in its environment. (No two types of organisms can occupy exactly the same niche in a community. During an animal's life cycle, its niche can change. For example: What the animal eats, what eats it, and other relationships.)

**Ecosystem** – groups of living things and the environment they live in; includes the ways living things interact with other living things and non-living things

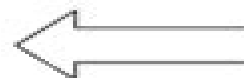

**Community** – a group of organisms that share an environment

**Life Cycle** – the various stages of life (ex: egg, tadpole, frog)

**Humans have a major impact on ecosystems:**

**Positive Impacts**

**Negative Impacts**
