Rubinstein, Wright Group/McGraw-Hill Staff, 2002-07 *School Science and Mathematics*, 1918 **Geometric Modeling and Processing 2000** Ralph Martin, Wenping Wang, 2000 Annotation The 39 papers anticipate the first in a series of biennial international conferences on solid modeling shape representation and geometric computation all of which are procedures important in a wide range of disciplines including computer graphics computer aided design computer vision medical imaging and scientific computation The largest number of them address various ideas in curve and surface modeling from long standing issues such as interpolation and approximation to recently popular ideas such as polyhedral and subdivision methods and more specific areas such as blending deformations implicitization and parametrized design Attracting the second most attention is solid modeling from such perspectives as inputting models from sketches and from scanned data subdivision modeling and trimmed patches Discussions of applications include polygon mesh refinement in computer graphs modeling the draping of cloth generating moulds and watermarking polygon meshes for security There is no subject index Annotation copyrighted by Book News Inc Portland OR *The Configuration Space Method for Kinematic Design of Mechanisms* Elisha Sacks, Leo Joskowicz, 2010 A novel algorithmic approach to mechanism design based on a geometric representation of kinematic function called configuration space partitions This book presents the configuration space method for computer aided design of mechanisms with changing part contacts Configuration space is a complete and compact geometric representation of part motions and part interactions that supports the core mechanism design tasks of analysis synthesis and tolerancing It is the first general algorithmic treatment of the kinematics of higher pairs with changing contacts It will help designers detect and correct design flaws and unexpected kinematic behaviors as demonstrated in the book's four case studies taken from industry After presenting the configuration space framework and algorithms for mechanism kinematics the authors describe algorithms for kinematic analysis tolerancing and synthesis based on configuration spaces The case studies follow illustrating the application of the configuration space method to the analysis and design of automotive micro mechanical and optical mechanisms Appendixes offer a catalog of higher pair mechanisms and a description of HIPAIR an open source C mechanical design system that implements some of the configuration space methods described in the book including configuration space visualization and kinematic simulation HIPAIR comes with an interactive graphical user interface and many sample mechanism input files *The Configuration Space Method for Kinematic Design of Mechanisms* will be a valuable resource for students researchers and engineers in mechanical engineering computer science and robotics **Mathematics Magazine**, 1970 *Models for Parallel and Distributed Computation* R. Correa, Ines de Castro Dutra, Mario Fiallos, Luiz Fernando Gomes da Silva, 2013-06-29 Parallel and distributed computation has been gaining a great lot of attention in the last decades During this period the advances attained in computing and

communication technologies and the reduction in the costs of those technologies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences. Many actual applications have been successfully implemented in various platforms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures. Parallel and distributed computation differs from classical sequential computation in some of the following major aspects: the number of processing units, independent local clock for each unit, the number of memory units, and the programming model. For representing this diversity and depending on what level we are looking at the problem, researchers have proposed some models to abstract the main characteristics or parameters: physical components or logical mechanisms of parallel computers. The problem of establishing a suitable model is to find a reasonable trade-off among simplicity, power of expression, and universality. Then be able to study and analyze more precisely the behavior of parallel applications.

The American Mathematical Monthly, 1927. Includes section Recent publications. **Advances in Nuclear Science and Technology** Jeffery Lewins, Martin Becker, 2012-12-06. Our previous volume 14 was devoted to an exposition of the topics of sensitivity analysis and uncertainty theory with its development and application in nuclear reactor physics at the heart of the discussion. In this volume we return to our customary format as a selection of topics of current interest authored by those working in the field. These topics range from the theoretical underpinnings of the linear Boltzmann transport equation to a resume of our expectations in what still may be thought of as twenty-first century technology: the world's fusion reactor program. In the first article of this volume we have Protopopescu's analysis of the structure of the Boltzmann equation and its solutions for energy and space-dependent problems of an eigenvalue nature. There long has been a curious folk-history effect in this area. Wigner and Weinberg could describe it as what was generally known was generally untrue. This account of the Boltzmann equation surely will show that a rigorous basis for our expectations of certain solutions can be well founded on analysis. Ely Gelbard's review of the methods of determining diffusion-type parameters in complex geometries where simple diffusion theory would be welcome has required just as much rigor to determine how such modeling can be made accurate although to a more immediate and practical purpose. The two articles can be seen as interesting contrasts, facets of the same underlying problem showing apparently different aspects of the same central core. *Harvard Alumni Bulletin*, 1937. **Technical**
