California Smart-growth Trip Generation Rates Study Susan Handy, Kevan R. Shafizadeh, Robert Schneider, 2013

Fort George G. Meade, Addressing Campus Development, 2010 **Enhancing Internal Trip Capture**

Estimation for Mixed-use Developments Brian S. Bochner, Kevin G. Hooper, Benjamin R. Sperry, Robert T. Dunphy, 2011

TRB's National Cooperative Highway Research Program NCHRP Report 684 Enhancing Internal Trip Capture Estimation for Mixed Use Developments explores an improved methodology to estimate how many internal trips will be generated in mixed use developments trips for which both the origin and destination are within the development The methodology estimates morning and afternoon peak period trips to and from six specific land use categories office retail restaurant residential cinema and hotel The research team analyzed existing data from prior surveys and collected new data at three mixed use development sites The resulting methodology is incorporated into a spreadsheet model which is available online for download

New Jersey Register, 2012-11 *Using the Engineering Literature* Bonnie A. Osif, 2016-04-19 With the encroachment of the Internet into nearly all aspects of work and life it seems as though information is everywhere However there is information and then there is correct appropriate and timely information While we might love being able to turn to Wikipedia for encyclopedia like information or search Google for the thousands of links **Report**, 2012 TRB joint National

Cooperative Highway Research Program NCHRP Report 739 National Cooperative Freight Research Program NCFRP Report 19 Freight Trip Generation and Land Use explores the relationship between freight trip generation and land use The report consolidates available freight trip generation models in an electronic database to assist practitioners interested in using these models identifies potential approaches to develop and apply freight trip generation models and estimates establishment level freight trip generation models in a number of case studies Publisher's description **Establishment of Local Trip**

Generation Rates Or Equations for Mixed-use Developments in Kansas Mehrdad Givchi, 2012 Currently the trip generation rates and equations contained in the Institute of Transportation Engineers ITE Trip Generation Manual 8th Edition are based on the information collected at single use free standing sites and cannot be directly applied to multi use developments Application of this data for multi use development sites requires use of an adjustment factor called internal capture rate which is expressed as a percent reduction to the trips generated by individual land uses These reductions are applied externally to the site at the entrances adjacent intersections and roadways They are distinct and separate from pass by and diverted link trips and are applied before pass by and diverted link trip reductions are applied While the trip generation rates for individual uses on a multi use development site may be the same or similar to what they are for free standing sites there is potential for interaction between among those uses within the site particularly where the trip can be made by walking As a result the total generation of vehicle trips entering and exiting the multi use site may be reduced from simply a sum of the individual discrete trips generated by each land use Because the development of mixed use or multi use

sites is increasingly popular ITE wishes to increase the database on multi use developments in order to provide internal capture data for a broader range of land uses ITE would appreciate additional data from analyses of such developments The goal of this research project is to establish a local trip generation rate model for multi use developments in state of Kansas which can potentially be submitted to the ITE headquarter for inclusion in the national database as well The primary objectives were to identify several appropriate multi use development sites in the state and document vehicular trip data generated by each site in order to develop a trip generation model that can be used to better estimate trip numbers generated by such sites A total of three sites were selected and studied for this project including Mission Farms and Park Place developments both in Leawood Kansas and Metcalf95 Complex in Overland Park Kansas
