Concrete Designers' Manual, Tables and Diagrams for the Design of Reinforced Concrete Structures George A. Hool, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1921 edition Excerpt moment should extend on each side of a line drawn through the column center at right angles to the direction of the band at least a distance equal to thirty five one hundredths of the panel length and bars in diagonal bands used as reinforcement for positive moment should extend on each side of a diagonal through the center of the panel at least a distance equal to thirty five one hundredths of the panel length and no splice by lapping should be permitted at or near regions of maximum stress except as just described Continuity of reinforcing bars is considered to have advantages and it is recommended that not more than one third of the reinforcing bars in any direction be made of a length less than the distance center to center of columns in that direction Continuous bars should not all be bent up at the same point of their length but the zone in which this bending occurs should extend on each side of the assumed point of inflection and should cover a width of at least one fifteenth of the panel length Mere draping of the bars should not be permitted In four way reinforcement the position of the bars in both diagonal and rectangular directions may be considered in determining whether the width of zone of bending is sufficient m Reinforcement at Construction Joints It is recommended

that at construction joints extra reinforcing bars equal in section to 20 per cent of the amount necessary to meet the requirements for moments at the section where the joint is made be added to the reinforcement these bars to extend not less than 50 diameters beyond the joint on each side n Tensile and Compressive Stresses The usual method of calculating the tensile and compressive stresses in the concrete and in the reinforcement based on **Spreadsheets in Structural Design** S. R. Davies,1995 Spreadsheets in Structural Design provides a unique and highly practical explanation of the use of spreadsheets to facilitate the design of structures in a range of key materials such as concrete steel and brick Using spreadsheets in this way has important implications in terms of cost and efficiency and represents a very useful tool hitherto largely neglected by the design community Each chapter contains spreadsheet layouts to illustrate the method drawn from different areas of design and using a range of materials and Codes of Practice Examples used relate to reinforced concrete reinforced masonry and steel but the approach is easily extended to other materials and other fields of design Practising structural engineers civil engineers and architects will find this book an invaluable guide for the solution of routine design problems It is also useful reading for advanced undergraduate and postgraduate students of structural design civil engineering and architecture **Design of Reinforced Concrete Structures** Henry J.
