Maths Gr 9 Memo Nov 2014:

Routines of Substitution Mark Priestley, 2018-08-14 This work is a historical and philosophical study of the programming work carried out by John von Neumann in the period 1945-8. At the heart of the book is an examination of a manuscript featuring the earliest known surviving example of von Neumann's coding a routine written in 1945 to mesh two sequences of data and intended to be part of a larger program implementing the algorithm now known as mergesort. The text of the manuscript itself along with a preliminary document describing the code he used to write this program are reproduced as appendices. The program is approached in three chapters describing the historical background to von Neumann's work, the significance of the sorting application itself and the development of the EDVAC, the machine for which the program was written. The subsequent chapters widen the focus again discussing the subsequent evolution of the program and the crucial topic of subroutines before concluding by situating von Neumann's work in a number of wider contexts. The book also offers a unifying philosophical interpretation of von Neumann's approach to coding.

Universities and the Purpose of Higher Education Josh Patel, 2026-01-22 This thought provoking book addresses the persistent anxieties surrounding the purpose and direction of higher education offering a nuanced historical perspective on its transformation. Using Cold War Britain as a lens, this book challenges the prevailing narrative that marketisation was an external imposition, revealing instead how the dynamic priorities of social democratic higher education inadvertently paved the way for their own supersession. Drawing on novel archival insights, it explores experimental initiatives by university leaders and employers and reveals how post-war public investment in universities was justified through a dual logic: empowering young people to pursue their individual self-interest while cultivating the ethical application of specialist knowledge in service of liberal capitalism. It goes on to show how the novel accountability frameworks they constructed intended to maximise freedom contained unstable tensions, tensions that remain in today's neoliberal system. Packed full of research, case studies and policy implications, this book interrogates the successes and failures of innovative teaching and learning practices as well as the evolving relationship between universities and industry. Throughout, the author offers critical insights into how liberal education might be reimagined to sustain universities in their service to the common good. This is essential reading for students, academics, policymakers and anyone seeking to understand the moral principles underpinning higher education and their influence on its future.

The Turing Guide Jack Copeland, Jonathan Bowen, Mark Sprevak, Robin Wilson, 2017-02-16 Alan Turing has long proved a subject of fascination but following the centenary of his birth in 2012, the code breaker, computer pioneer, mathematician and much more, has become even more celebrated with much media coverage and several meetings, conferences and books raising public awareness of Turing's life and work. This volume will bring together contributions from some of the leading experts on Alan Turing to create a comprehensive guide to Turing that will serve as a useful resource for researchers in the area as well as the increasingly interested general reader. The book will cover aspects of Turing's life and

the wide range of his intellectual activities including mathematics code breaking computer science logic artificial intelligence and mathematical biology as well as his subsequent influence
