Very Low Temperature and Thermal Conductivity

Thermal conduction is the process by which thermal energy is transferred through matter. Heat transfer occurs at a lower rate in materials of low thermal conductivity than in materials of high thermal conductivity. For instance, metals typically have high thermal conductivity and are very efficient at conducting heat, while the opposite is true for insulating materials like Styrofoam. The following graph shows the thermal conductivities for four metals at very low temperatures.

Sound and Hearing

Noise is one of the most common occupational health hazards. In heavy industrial and manufacturing environments, permanent hearing loss is a health concern. Repeated or prolonged noise levels at or above 85 dBA can cause hearing damage. The louder the sound, the shorter the time it takes to damage a person's hearing. Average conversations are about 60 dBA, alarm clocks are about 80 dBA, and most concerts are about 120 dBA. You can listen to 90 dBA for up to 8 hours a day before you begin to lose hearing, but if you listen to 120 dBA it only takes about 15 minutes before your hearing is damaged. A group of students recorded the volume of the school cafeteria during lunch times for different classes over two months. The data is shown in the graph.
