This book is the only math book you'll need for the first semester of undergraduate studies in science. With concise jargon-free lessons on topics in math and physics, each section covers one concept at the level required for a first-year university course. Anyone can pick up this book and become proficient in calculus and mechanics regardless of their mathematical background.

Dynamical Systems with Applications using MAPLE Stephen Lynch, 2013-11-11 This book provides an introduction to the theory of dynamical systems with the aid of the Maple algebraic manipulation package. It is written for both senior undergraduates and first-year graduate students. The first half of the book deals with continuous systems using ordinary differential equations. Chapters 1-12 and the second half is devoted to the study of discrete dynamical systems. Chapters 13-20. The author has gone for breadth of coverage rather than fine detail and theorems with proof are kept at a minimum. The material is not clouded by functional analytic and group theoretical definitions and so is intelligible to readers with a general mathematical background. Some of the topics covered are scarcely covered elsewhere. Most of the material in Chapters 9-12, 16-17, 19, and 20 is at postgraduate level and has been influenced by the author's own research interests. It has been found that these chapters are especially useful as reference material for senior undergraduate project work. The book has a very hands-on approach and takes the reader from the basic theory right through to recently published research material.

Dynamical Systems with Applications using Maple™ Stephen Lynch, 2009-12-23 Since the first edition of this book was published in 2001, the algebraic computation package Maple has evolved from Maple V into Maple 13. Accordingly, the second edition has been thoroughly updated and new material has been added. In this edition, there are many more applications, examples, and exercises, all with solutions, and new chapters on neural networks and simulation have been added. There are also new sections on perturbation methods, normal forms, Gröbner bases, and chaos synchronization. This book provides an introduction to the theory of dynamical systems with the aid of the Maple algebraic manipulation package. It is written for both senior undergraduates and graduate students. The first part of the book deals with continuous systems using ordinary differential equations. Chapters 1-10, the second part is devoted to the study of discrete dynamical systems. Chapters 11-15 and Chapters 16-18 deal with both continuous and discrete systems. Chapter 19 lists examination-type questions used by the author over many years, one set to be used in a computer laboratory with access to Maple and the other set to be used without access to Maple. Chapter 20 lists answers to all of the exercises given in the book. It should be pointed out that dynamical systems theory is not limited to these topics but also encompasses partial differential equations, integral and integro-differential equations, stochastic systems, and time delay systems, for instance. References 1-5 given at the end of the Preface provide more information for the interested reader.
