Theoretical Studies of Radiation Effects in Composite Materials for Space Use C. Ken Chang,1982 Tetraglycidyl 4,4'-diamino diphenyl methane epoxy cured with diamino diphenyl sulfone was used as a model compound Computer programs were developed to calculate 1 energy deposition coefficients of protons and electrons of various energies at different depths of the material 2 ranges of protons and electrons of various energies in the material and 3 cumulative doses received by the composite in different geometric shapes placed in orbits of various altitudes and inclination A preliminary study on accelerated testing was conducted and it was found that an elliptical equatorial orbit of 300 km perigee by 2750 km apogee can accumulate in 2 years or less enough radiation dose comparable to geosynchronous environment for 30 years The local plasma model calculated the mean excitation energies for covalent and ionic compounds Longitudinal and lateral distributions of excited species by electron and proton impact as well as the probability of overlapping of two tracks due to two charged particles within various time intervals were studied **The School Librarian** ,2003 **Proceedings of the National Science Council, Republic of China** ,1997
