

## Operation

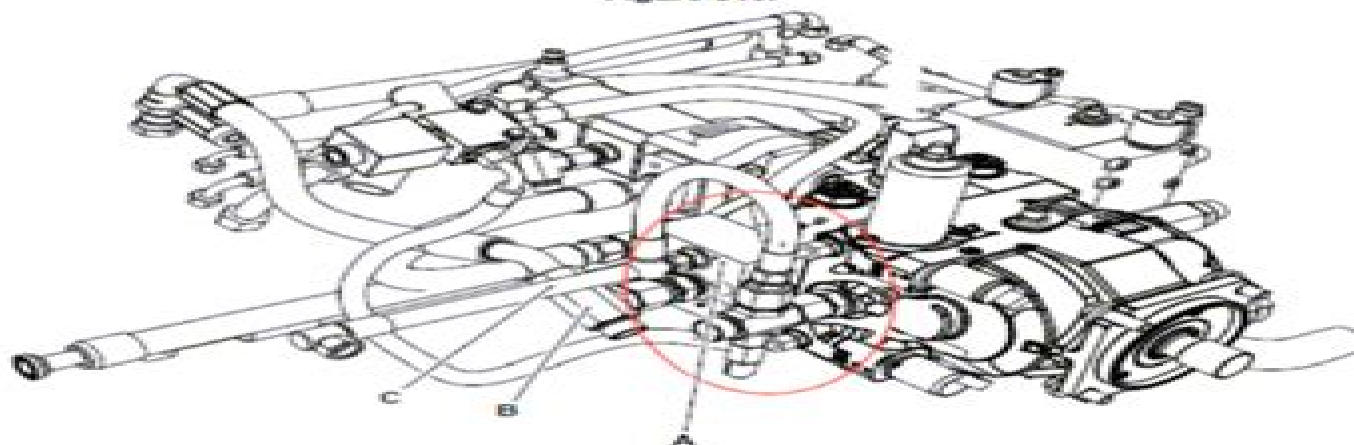

The purge valve makes sure that the hydraulic oil is constantly bled from the closed loop transmission circuit for cooling.

When the forward direction drive is selected by the operator, the high forward loop pressure pushes the spool to connect the flow to the reverse low pressure (charge) line to the cooler through the metering valve.

When the operator selects the reverse direction drive, the forward drive line is connected to the cooler in the same way.

The loop is kept topped up through the multi-function valves in the main hydraulic pump. The charge pressure makes sure that the return side of the loop circuit is always under pressure.
