Abstract:

The advent of a revolutionary and exciting theory that proposes non-linear models as effective adjuncts to linear mathematics in interpreting long-held scientific tenets has provided novel and innovative designs and methodologies that help the medical world to better understand inferences from laboratory investigations, physiological processes, pharmacotherapeutics and clinical diagnostics.

This overview outlines a few salient areas in medicine that have successfully applied the principles of the chaos theory. Chaotic systems have been shown to operate in quite a few physiological processes. The impact and implications of the new science on the future course of medical diagnostics and health science systems as a whole cannot be overstressed.

Keywords: chaos theory, non-linear mathematics, fractal, randomness

Introduction :

Lorenz an American mathematician and meteorologist was the pioneer of the chaos theory. He studied weather patterns he began to realize that they did not always change as predicted. Minute variations in the initial values of variables in his twelve-variable computer weather model would result in grossly divergent weather patterns. This sensitive dependence on initial conditions came to be known as the butterfly effect.^{1,2}

Figure 1: Lorenz's experiment: the difference between the starting values of these curves is only .000127. (Ian Stewart, Does God Play Dice? The Mathematics of Chaos, pg. 141)

The application of the radically and new non-linear science of 'chaos' has been slow in acceptance in the medical field; each and every diagnostic, investigative

and pharmacotherapeutic process involved in health science is dictated by direct Newtonian tenets of cause effect and linear mathematical derivations. Exclusive and total dependence on scalar models have compartmentalized patient profiles into rigid cocoons such as age, sex, weight, height, physiological and biochemical evaluations making interventional therapeutic regimens solely dictated by our over-riding choice to use scales of convenience for every single one of our evaluation, assessment and treatment criteria.

The new field of theoretical biology, spawned by the advent and ready acceptance of the 'chaos' model has led to an explosion in nascent schools of thought that challenge hitherto entrenched linear mathematical Newtonian and Euclidian principles in natural sciences. Fractal configurations and such other non-linear systems have made the need for a second look at physio-dynamic processes of the human biology, mandatory. Despite rapid strides in the alternate chaotic and randomness applications, the world of medicine is still loathe to modify its dependence and confidence in pharmacokinetic therapeutic solutions based on cause-effect and Euclidean extrapolation linear systems, both in diagnosis and treatment.
