Micro Chip Nmea Interface:

Microchip AVR® Microcontroller Primer Steven F. Barrett, Daniel J. Pack, 2022-05-31 This textbook provides practicing scientists and engineers a primer on the Microchip AVR microcontroller. The revised title of this book reflects the 2016 Microchip Technology acquisition of Atmel Corporation. In this third edition we highlight the popular ATmega164 microcontroller and other pin for pin controllers in the family with a complement of flash memory up to 128 KB. The third edition also provides an update on Atmel Studio programming with a USB pod, the gcc compiler, the ImageCraft JumpStart C for AVR compiler, the Two Wire Interface TWI and multiple examples at both the subsystem and system level. Our approach is to provide readers with the fundamental skills to quickly set up and operate with this internationally popular microcontroller. We cover the main subsystems aboard the ATmega164 providing a short theory section followed by a description of the related microcontroller subsystem with accompanying hardware and software to operate the subsystem. In all examples we use the C programming language. We include a detailed chapter describing how to interface the microcontroller to a wide variety of input and output devices and conclude with several system level examples including a special effects light emitting diode cube, autonomous robots, a multi function weather station and a motor speed control system.

Modelling and Control of an Autonomous Two-Wheeled Vehicle Alen Turnwald, 2020-11-13 With respect to the future urban mobility, modern electrical bicycles, advanced motorcycles and innovative two wheeled vehicles are attracting enormous amount of attention. Especially model based control and optimal trajectory planning for such vehicles are important to the research and development of the future. Therefore a reliable and yet usable vehicle model as well as a systematic approach to motion control for two wheeled vehicles are essential to which this work makes a contribution. Currently available two wheeled vehicle models are mostly either too complex to be used for a systematic control synthesis or too simple such that the physical behaviour of the vehicle is no more represented. In this thesis a unifying approach to modelling and control for autonomous two wheeled vehicles is presented. The resulting model is generally valid and physically detailed enough to represent the characteristic dynamical behaviour such as the self stability. At the same time it is suited to a systematic control synthesis. Furthermore the systematic extendability for instance by a rider is demonstrated. The model is validated by simulations and by comparison to well known models from the literature. The proposed vehicle model is derived in the Lagrangian and Hamiltonian framework and used for model based optimal trajectory planning. Furthermore a passivity based trajectory tracking controller is designed based on the resulting port Hamiltonian system using the so called generalised canonical transformations. Such a controller is physically interpretable and robust against parameter uncertainties. To this end existing approaches of passivity based controller design are extended and adjusted for two wheeled vehicles. Finally a prototype two wheeled vehicle is introduced which is used for experimental validation of the model and to demonstrate motion control algorithms for autonomous two wheeled vehicles.
