The mathematics of vertex operator algebras, vector-valued modular forms, and finite group theory continues to provide a rich and vibrant landscape in mathematics and physics. The resurgence of moonshine related to the Mathieu group and other groups, the increasing role of algebraic geometry, and the development of irrational vertex operator algebras are just a few of the exciting and active areas at present. The proceedings center around active research on vertex operator algebras and vector-valued modular forms and offer original contributions to the areas of vertex algebras and number theory. Surveys on some of the most important topics relevant to these fields, introductions to new fields related to these, and open problems from some of the leaders in these areas. **Representations of Algebras, Geometry and Physics** Kiyoshi Igusa, Alex Martsinkovsky, Gordana Todorov, 2021-05-17 This volume contains selected expository lectures delivered at the 2018 Maurice Auslander Distinguished Lectures and International Conference held April 25-30, 2018 at the Woods Hole Oceanographic Institute, Woods Hole, MA. Reflecting recent developments in modern representation theory of algebras, the selected topics include an introduction to a new class of quiver algebras on surfaces called geodesic ghor algebras, a detailed presentation of Feynman categories from a representation theoretic viewpoint, connections between representations of quivers and the structure theory of Coxeter groups, powerful new applications of approximable triangulated categories, new results on the heart of a t-structure, and an introduction to methods of constructive category theory. **2-Dimensional Categories** Niles Johnson, Donald Yau, 2021-01-31 Category theory emerged in the 1940s in the work of Samuel Eilenberg and Saunders Mac Lane. It describes relationships between mathematical structures. Outside of pure mathematics, category theory is an important tool in physics, computer science, linguistics, and a quickly growing list of other sciences. This book is about 2-dimensional categories, which add an extra dimension of richness and complexity to category theory. 2-Dimensional Categories is an introduction to 2-categories and bicategories, assuming only the most elementary aspects of category theory. A review of basic category theory is followed by a systematic discussion of 2-bicategories, pasting diagrams, lax functors, 2-limits, the Duskin nerve, 2-nerve, internal adjunctions, monads in bicategories, 2-

monads biequivalences the Bicategorical Yoneda Lemma and the Coherence Theorem for bicategories Grothendieck fibrations and the Grothendieck construction are discussed next followed by tricategories monoidal bicategories the Gray tensor product and double categories Completely detailed proofs of several fundamental but hard to find results are presented for the first time With exercises and plenty of motivation and explanation this book is useful for both beginners and experts
