WAIMH Handbook of Infant and Early Childhood Mental Health Joy D. Osofsky, Hiram E. Fitzgerald, Miri Keren, Kaija Puura, 2024-02-19 This book examines basic knowledge in the field of infant and early childhood mental health. It focuses on cognitive, social, and emotional development of infants and toddlers and examines different aspects of neurobiological development, including genes and epigenetics, as well as biobehavioral synchrony. In addition, the book addresses parenting and caregiving issues, including attachment, parent-infant relationships, and high-risk factors, e.g., the effects of trauma on the infant-caregiver relationship, adolescent parenting, and parents with substance abuse disorders. Key areas of coverage include: Social, emotional, and cognitive development during infancy and early childhood; Temperament in infants and toddlers; Neurobiological influences from infancy through early childhood; Parenting and caregiving of infants and toddlers; Reflective functioning, mentalization, and infant development. The WAIMH Handbook of Infant and Early Childhood Mental Health, Volume One, is a must-have reference for researchers, professors, and graduate students, as well as clinicians and all related therapists and professionals in infancy and early child development, developmental psychology, pediatrics, child and adolescent psychiatry, clinical social work, public health, and all related disciplines.

Such contact may occur at quite different levels: man and nonhuman primates may share the same ecosystem, including the presence of vectors; in the countries of origin of monkeys and apes, the animals are captured to be sold or used for food; field researchers have to stay near the animals in the wild; an uncontrolled human population gets close enough to almost touch the animals in zoological gardens around the world; pet owners establish bodily contact; and finally, researchers doing surgery or necropsies are exposed to an increased number of pathogens liberated from the organs and body fluids. Usually, monkeys and apes are more threatened with catching the microorganisms indigenous to man than vice versa, but nevertheless, outbreaks of true zoonoses with nonhuman primates as the source of infection have occurred. Also, the retransmission of originally human pathogens via nonhuman primates to man may pose a considerable risk to human health. Unfortunately, the information on the different agents transmissible between man and his relatives is too disseminated for practical use, as it involves quite different scientific disciplines, such as virology, bacteriology, parasitology, primatology, laboratory animal science, etc. It seemed therefore necessary to compile the current knowledge concerning this topic in a single publication. Human infections of simian origin may be caused by several viruses, bacteria, fungi, or endoparasites. Ectoparasites, in comparison, are of little importance.
