THE MOON

Have you seen the moon? Its like a mysterious big bright balloon. It appears in the sky every night. Have you ever thought what Moon is? Why does it appear in a different shape every night? Why does it shine? How big is it? You will be fascinated, once you discover these answers.

The Moon is a natural satellite of Earth. Satellites are objects in space that orbit around a planet. Moon is revolving around the Earth. Our planet Earth has only one moon. Jupiter has 79 moons. How fascinating our sky would have looked, if our Earth had 79 moons!

Moon takes 27 days to revolve around the Earth. So a year on moon is 27 days long. On Earth, one year has 365 days. Means one year on Earth is equal to about 13 years on the Moon.

From Earth our moon appears like a small ball. But in reality the moon is about one-fourth of Earth in size. Means you can fit 4 moons in one Earth. Not all moons are that big. Earth's moon is the fifth largest moon in the solar system. The largest is Jupiter's moon Ganymede. Moon is 238,900 miles (384,400 km) away from Earth.

There is no atmosphere on moon. Sound needs air to travel, so no air means no sound. That is why Earth's moon is a silent place. There is no air to breathe. Because there is no atmosphere, moon has extremely hot days and extremely cold nights.

Gravity on moon is about one-sixth that on Earth. Means on moon you can jump about 6 times higher than on Earth. And on moon, you will weigh only one-sixth of your weight on Earth.

Moon does not have its own light. It shines because it reflects sunlight. Parts of moon that reflects sunlight appears bright, the other parts
