Inverse Obstacle Scattering with Non-Over-Determined Scattering Data Alexander G. Ramm,2022-06-01 The inverse obstacle scattering problem consists of finding the unknown surface of a body obstacle from the scattering where \mathbf{r} is the scattering amplitude \mathbf{d} is the direction of the scattered incident wave respectively \mathbf{d} is the unit sphere in the \mathbb{R}^3 and $k > 0$ is the modulus of the wave vector The scattering data is called non over determined if its dimensionality is the same as the one of the unknown object By the dimensionality one understands the minimal number of variables of a function describing the data or an object In an inverse obstacle scattering problem this number is 2 and an example of non over determined data is $(0,0)$ By sub index 0 a fixed value of a variable is denoted It is proved in this book that the data known for all in an open subset of \mathbf{d} determines uniquely the surface and the boundary condition on This condition can be the Dirichlet or the Neumann or the impedance type The above uniqueness theorem is of principal importance because the non over determined data are the minimal data determining uniquely the unknown There were no such results in the literature therefore the need for this book arose This book contains a self contained proof of the existence and uniqueness of the scattering solution for rough surfaces
